

Healthy data means healthy business

Database Health Check

Focus on management, not on managing data

Your data is hugely valuable. But what if your database is at risk or is running inefficiently?

Data underpins everything we do in today's business world. Organisations now have access to more information than ever before, but are struggling to use and manage it effectively. Although this volume of data presents many opportunities, businesses now face challenges such as managing increasing data volumes and planning for disasters. This data expansion can result in inefficient databases, leading in turn to poor application performance and loss of productivity.

Regardless of the complexity of your data environment, HP's unique DBAudit and DBAudit Express services will help you to understand your databases and provide direction to improve your technology and your business.

Why employ an HP DB assessment?

HP has the professionals with the experience and skills to analyse your databases and guide you to improve them. At the conclusion of the health check, we will provide a thorough analysis and recommendations to improve database performance and longevity, and ultimately facilitate improved productivity and effective analytics. Choose HP's DBAudit services if:

- You want confidence in your database environment
- You have had recent database problems with unsatisfactory explanations
- You need verification of a new environment
- You want to confirm another audit's findings
- The technologies/environments are new and staff are still in training/up skilling
- You have just inherited the environment from a merger, or other restructuring.

Intellimin and HP

Intellimin, a New Zealand based creator of an innovative insurance policy sales and administration system relies on HP to keep their database operations smooth and effective. To ensure that Intellimin can continue to operate at peak performance, HP conducts quarterly database health checks.

During these check-ups, HP's database professionals analyse configuration, capacity, performance, objects, backup, patching and recovery. The status of each of these is then reported to Intellimin with recommendations for potential improvements as well as an overview of any future issues that may arise.

Through Intellimin and HP's quarterly engagements, Intellimin are regularly updated on any potential issues that could occur. With this insight, they are able to act promptly to resolve any issues and can focus on delivering excellent service to their clients.
